An experiment is a procedure carried out to support or refute a hypothesis, or determine the efficacy or likelihood of something previously untried. Experiments provide insight into cause-and-effect by demonstrating what outcome occurs when a particular factor is manipulated. Experiments vary greatly in goal and scale but always rely on repeatable procedure and logical analysis of the results.

Fig.1 Schematic representation of Hall Effect in a conductor. CCG - Constant Current Generator, J X - current density \bar{e} - electron, B - applied magnetic field t - thickness, w - width V H - Hall voltage . If the magnetic field is applied along negative z-axis, the Lorentz force moves the charge carriers (say electrons) toward the y-direction.

Correlation Coefficient is a statistical concept, which helps in establishing a relation between predicted and actual values obtained in a statistical experiment. The calculated value of the correlation coefficient explains the exactness between the predicted and actual values. Correlation Coefficient value always lies between -1 to +1.
